

Rocks With Negative Dates

Rocks With Negative Dates

By Paul Nethercott

August 2013

Introduction

How reliable is radiometric dating? We are repeatedly told that it proves the Earth to be billions of years old. If radiometric dating is reliable than it should not contradict the evolutionary model. According to the Big Bang theory the age of the Universe is 10 to 15 billion years.¹ Standard evolutionist publications give the age of the universe as 13.75 Billion years.^{2,3}

Standard evolutionist geology views the Earth as being 4.5 billion years old. Here are some quotes from popular text: "The age of the Earth is 4.54 ± 0.05 billion years."⁴ "The Solar System, formed between 4.53 and 4.58 billion years ago."¹ "The age of 4.54 billion years found for the Solar System and Earth."¹ "A valid age for the Earth of 4.55 billion years."^{5,6}

Evolutionists give the age of the galaxy as "11 to 13 billion years for the age of the Milky Way Galaxy."^{1,7} Let us remember this as we look at the following dating as given in secular science journals.

1. Ion Microprobe U-Pb Dating

These rocks from Japan were dated⁸ in 2001 using the Rubidium/Strontium and Potassium/Argon method. If we run the isotopic ratios through Isoplot⁹ and use formulas listed in standard geology books¹⁰ we find that the rock samples¹¹ gave ages between 5 billion years and negative years old! Since the Earth exists in the present how can rocks have formed in the future? How can a rock be older than the Earth? The author admits some of the dates are negative: "Though a negative age has no practical use, it does suggest that it is younger than 0.12 Ma."¹²

Table 1

Table 2	Age	Age	Age
Data	206Pb/238U	207Pb/206Pb	Ratio
Average	62	4,710	76
Maximum	631	5,135	8
Minimum	0	3,771	3771

Table 2

Table 3	Age	Age	Age
Data	206Pb/238U	207Pb/206Pb	Ratio
Average	0.88	4,742	5,388
Maximum	2.91	4,978	1,710
Minimum	0.25	4,479	17,916

2. The Long Valley Rhyolitic

These rocks from California were dated¹³ in 1997 using the Rubidium/Strontium and Potassium/Argon method. The rock samples gave ages between 1 million years and negative years old! Since the Earth exists in the present how can rocks have formed in the future? The author admits some of the dates are negative:

"The negative ages are a clear indication that some phases have not reached Sr isotope equilibration with their current host glass."¹⁴

"In contrast, feldspars from the second group yield mineral ages that are geologically unreasonable ranging from close to the eruption age of the Bishop Tuff to negative ages."¹⁵

Rocks With Negative Dates

3. Rn-Generated 206Pb

These rocks from South Africa were dated ¹⁶ in 1998 using the Uranium/Lead method. When we run the ratios ¹⁷ through Isoplot the rock samples gave ages between 543 and 6,400 million years old! Since the Earth exists in the present how can rocks have formed in the future? How can a rock be older than the Earth? According to the article the true age is between 2 and 2.6 billion years old: “Assigning a 2.02 Ga age of mineralization and constructing secondary isochrons for paragenetically early galena and chalcocopyrite, ages of the source uraninite are calculated as 2.6-2.4 Ga.”¹⁸

Table 3

Age	Age
Pb 207/206	Pb 207/206
6451	5799
6330	5763
6315	5735
6217	5723
6109	5711
6009	4966

The author admits some of the dates are negative: “Analyses lying even farther to the right, with the implication of implausibly young and even negative ages, force us to consider alternative explanations for this subsidiary array.”¹⁹

4. 40Argon/39 Argon Age of a Tholeiitic Basalt

These rocks from California were dated ²⁰ in 2006 using the Argon method. The rock samples gave ages ²¹ between 2,357 and -579 thousand years old! Since the Earth exists in the present how can rocks have formed in the future?

Table 4

Sample	Minimum	Maximum	Difference	Ratio
Cinder Butte	-579.3	56.7	636	1,022%
Andesite of Sugarloaf Peak	14.7	589.5	636	4,010%
Little Potato Butte	-51.6	585.9	637.5	1,135%
Andesite of Potato Butte 1	-386.3	164.5	550.8	235%
Andesite of Potato Butte 2	-289.6	2357.4	2647	814%
Hat Creek Basalt 1	10	2950	2647	29,500%
Hat Creek Basalt 2	-89.3	92.4	181.7	103%

The author admits some of the dates are negative: “The Ar isotopic data, when cast on an inverse isochron diagram, indicate that the first two steps are enriched in ³⁶Ar and thus yield negative ages. These first two steps are most likely influenced by low-temperature alteration of the sample.”²²

5. Isotopic Systematics of Ultramafic Xenoliths

These rocks from North China were dated ²³ in 2007 using the Rubidium/Strontium and Uranium/Lead methods. The rock samples gave ages ²⁴ between -3 and 9 billion years old! Since the Earth exists in the present how can rocks have formed in the future? How can a rock be 4.5 billion years older than the Earth? The author admits some of the dates are negative: “The Nd model ages for the individual data points are variable, from ~2.8 Ga to negative ages (Table 3), consistent with our earlier observation that REE patterns for all the samples display some degree of secondary metasomatic overprinting by LREE-enriched silicate melts.”²⁵

If we run the isotopic ratios ²⁴ through Isoplot we get the ages listed in table 6. There is a **12,698** million year spread of dates between the youngest [Negative] and the oldest [Positive] ages.

Rocks With Negative Dates

Table 5

Million Years	Million Years
-3,209	965
-1,747	2,803
136	4,383
530	7,935
600	

Table 6

207Pb/206Pb	206Pb/238U
5,049	9,489
5,035	1,821
5,034	338
5,029	95
5,012	
5,009	
5,006	
5,004	

6. Timing of Precambrian Melt Depletion

These rocks from Wyoming were dated ²⁶ in 2003 using the Rubidium/Strontium and Neodymium/Samarium method. The rock samples [Tables 7 & 8] gave ages ²⁷ between -2 and 50 billion years old! Since the Earth exists in the present how can rocks have formed in the future? How can a rock be 35 billion years older than the Big Bang explosion? The author admits some of the dates are negative: "That complete equilibrium was not achieved during this interaction is shown by the fact that the garnet-clinopyroxene tie lines for the different radiometric systems in the same sample do not provide ages that agree, and in the case of two of the Williams samples the Sm-Nd tie lines provide negative ages (Carlson et al., 1999a)." ²⁸

Table 7

Billion Years	Billion Years
-1.24	6
-1.24	7.46
-0.22	47.37
4.54	49.63

There is a 51,970 million year spread of dates between the youngest [Negative] and the oldest [Positive] ages.

Table 8

Billion Years	Billion Years
-2.34	-4.24
-1.75	-1.47
-0.98	-1.14
-0.86	-0.84
4.47	2.51

If we run the Lead 207/206 ratios ²⁹ through Isoplot we find that the rocks are 5 billion years old.

Rocks With Negative Dates

Table 9

Average	4,935
Maximum	5,118
Minimum	4,421

The author claims that the true age is just 2.6 billion years old: “The mean TMA of these five samples is 2.86 Ga (or 3.07 Ga without the apparently younger sample HK1-24), and given the lower bound mean TRD age of 2.61 Ga, a depletion age in the late Archean seems likely.”³⁰

7. Re-Os, Sm-Nd, and Rb-Sr Isotope Evidence

These rocks from Uganda were dated³¹ in 1993 using the Rubidium/Strontium and Neodymium/Samarium methods. Since the Earth exists in the present how can rocks be formed in the future? How can a rock be 6 billion years older than the Earth? The author admits some of the dates are negative:

“If Re-Os model ages are calculated using the conventional model age approach, i.e., using the measured Re/Os and osmium isotope composition in comparison to some model for bulk-Earth osmium isotope evolution, several peridotites yield negative ages, or ages that are considerably older than the Earth (Table 5). This indicates that some peridotites cannot have evolved as closed systems.”

If we run the Osmium isotope ratios³³ through Microsoft Excel we get the following results.

Table 10

Million Years	Million Years
-1,584	-6.46
-1,504	-1.58
-478	-0.73
-35	2.23
-19	2.78

187Os/186Os Ages

The rock samples below gave ages³² between -1.5 and 11 billion years old!

Table 11

Sm-Nd	Rb-Sr	% Ratio
258	5,454	2,114
959	6,245	651
434	12,716	2,930
2,038	1,351	66
1,157	4,026	348

Table 12

Re/Os	Sm/Nd	Rb/Sr
5.5	3.2	8.3
11	3	0.99
6.9	3	
6.6	2.7	
6 Negative	4 Negative	7 Negative

There is a 14,300 million year spread of dates between the youngest [Negative] and the oldest [Positive] ages.

Rocks With Negative Dates

Conclusion

Yuri Amelin states in the journal Elements that radiometric dating is extremely accurate: “However, four $^{238}\text{U}/^{235}\text{U}$ -corrected CAI dates reported recently (Amelin et al. 2010; Connelly et al. 2012) show excellent agreement, with a total range for the ages of only 0.2 million years – from 4567.18 ± 0.50 Ma to 4567.38 ± 0.31 Ma.”³⁴⁻³⁶

To come within 0.2 million years out of 4567.18 million years means an accuracy of 99.99562%. Looking at some of the dating it is obvious that precision is much lacking. The Bible believer who accepts the creation account literally has no problem with such unreliable dating methods. Much of the data in radiometric dating is selectively taken to suit and ignores data to the contrary.
